

NEODIO launches the first comprehensive solution to interference that impairs sound quality

At the High End in Munich, Hall 1, stand A13, 18 to 21 May 2017

In High Fidelity, sound quality is significantly impacted by the presence of specific vibrational interference outside the audio band. This interference propagates through solids, cables, chassis and cabinets. Ultimately, it interacts in the air with the sound that is being reproduced. This parasitic emission is responsible for a significant loss of definition. The more these parasitic effects can be absorbed in each element of the system, the better the resulting sound. The initial simplicity of this vibrational phenomenon conceals a complexity in its propagation and in its interaction with the operation of a HiFi system.

16 years of research have enabled Stéphane Even to understand the nature of these physical phenomena. Today, NEODIO offers an eco-system that relies on three product lines (anti-vibration support, electronic, and cable) all of which include major technical innovations.

Anti-vibration support

Origine B1 anti-vibration support

In 2015, Neodio introduced an entirely new approach with its patented Zero Vibration technology. This innovative system combats the harmful effects of vibrational interference on sound quality.

Its first application was in the Origine B1 support, which received unanimous praise in the French press.

ORIGINE B1

Cables

In 2017, Neodio is presenting three new cables at the High End in Munich that are a direct product of Zero Vibration technology:

The Origine P5 power cable, the Origine I3 interconnect, and the Origine LO speaker cable

These cables, combined with Origine B1 supports, completely suppress any interference that reduces sound quality.

The Origine cables complement the B1 supports by reducing interference that can also circulate in electrical connections. The result is a level of naturalness, transparency and tonal balance that is rarely achieved.

Electronic

Origine S2 Player

This CD player and DAC constitute one of the best digital sources in the world. It is based on proprietary technologies: a constrained layer chassis, Origine B1 supports, a third-generation zero-quartz clock, and a DVD-ROM mechanism modified by NEODIO. The sound from this machine pushes the boundaries of digital reproduction, offering a naturalness comparable to the best vinyl turntables.

- RCA and XLR outputs
- USB digital input
- SPDIF/RCA input
- 25 kg

Origine A2 Amplifier

This integrated amplifier uses a new amplification architecture, with only two stages and no overall negative feedback: a very low distortion voltage amplifier and a very high capacity current buffer (32A).

It incorporates a high-power supply with a 1000VA transformer. Zero Vibration technology is integrated through the B1 supports and internal cabling.

- 2x150W/8 ohms with current protection
- 2 RCA inputs
- 2 XLR inputs
- 28 kg

The Company

Founded in 2001 by electronic engineer Stéphane Even, NEODIO set itself the challenge of finding scientific answers to the «mysteries» of High Fidelity, such as the instability of sound performance, and the lack of correlation between measurements and the actual sound experience. In this way, technical progress can be made on the basis of innovative solutions that avoid unnecessary complexity. Neodio products are entirely designed and manufactured in France, to extremely high quality specifications.
